Introduction

Beamer allows you to create very nice slides. Here is a fairly simple slideshow to demonstrate a few basic uses of Beamer.

As you might expect from \LaTeX , it tries to position everything *just right*; having said that, \LaTeX was originally designed for print and presentation may require a bit more trial-and-error.

Revealing Items

Let's admit it, revealing items one-by-one is annoying.

Revealing Items

Let's admit it, revealing items one-by-one is annoying. Especially when the new item comes whirling in and distracts everyone from what the presenter is saying.

Revealing Items

Let's admit it, revealing items one-by-one is annoying. Especially when the new item comes whirling in and distracts everyone from what the presenter is saying. Having said that, hiding elements and revealing them can be used to your advantage.

Revealing Items

A better use a revealing item is to draw the attention.

Can you spot the odd one out?

Feynman

Einstein

Dirac

Riemann

Heineken

Can you spot the odd one out?

Feynman

Einstein

Dirac

Riemann (mathematician)

~~Heineken~~ Heisenberg

Placing Items

When people use PowerPoint, they like to place items all over the place inevitably resulting in clutter and distracting the audience.

If it is used well on the other hand (as with a diagram for example), the effect can be really quite good. Nevertheless, Beamer does not provide a very good way of placing items and this is perhaps the one thing that \LaTeX won't do as well as PowerPoint.

The End
